Sample Questions and Model Answers from the May 2014 Paper

Question 1: Explain why ionic compounds tend to have high melting points.

Model Answer: Ionic compounds have high melting points because they consist of a lattice of positive and negative ions held together by strong electrostatic forces. Overcoming these forces requires a significant amount of energy, which results in high melting temperatures.

Question 2: Given the following data from a titration: 25.0 cm³ of acid required 30.0 cm³ of alkali to neutralize. Calculate the concentration of the acid if the alkali concentration is 0.1 mol/dm³.

Model Answer:

Number of moles of alkali = concentration $\times$ volume = 0.1 mol/dm³ $\times$ 0.030 dm³ = 0.003 mol

Since the titration is 1:1, moles of acid = moles of alkali = 0.003 mol

Concentration of acid = moles / volume = 0.003 mol / 0.025 dm³ = 0.12 mol/dm³
