Sample Questions and Solutions from the 2014 Assignment

Example 1: Interpreting Data in a Table

Question: A survey was conducted on students' preferred modes of transportation. The results are shown in the table below:

Mode of Transport	Number of Students
Bus	120
Car	80
Bicycle	50
Walking	50

Question: What percentage of students preferred to travel by bus?

Solution:

$$\text{Total students} = 120 + 80 + 50 + 50 = 300$$

$$\text{Percentage preferring bus} = (120 / 300) \times 100 = 40\%$$

Example 2: Financial Calculation

Question: If a student saves R200 each month in a bank account offering 5% annual interest compounded monthly, how much will they have after 1 year?

Solution:

$$\text{Principal per month} = \text{R}200$$

$$\text{Number of months} = 12$$

$$\text{Monthly interest rate} = 5\% / 12 = 0.004167$$

Using the future value of a series formula:

$$FV = P \times [(1 + r)^n - 1] / r$$

Where:

$$P = \text{R}200$$

$$r = 0.004167$$

$$n = 12$$

$$FV = 200 \times [(1 + 0.004167)^{12} - 1] / 0.004167$$

$$FV = 200 \times [(1.0512) - 1] / 0.004167$$

$$FV = 200 \times 0.0512 / 0.004167$$

$$FV = 200 \times 12.29 = \text{R}2,458$$

So, the student will have approximately R2,458 after one year.

Sample Questions and Memorandum Answers

Below are examples of typical questions from the April 2014 assignment along with their detailed solutions as per the memorandum.

Question 1: Describe the process of photosynthesis, including the main stages and their significance.

Memorandum Answer:

Photosynthesis is the process by which green plants, algae, and some bacteria convert light energy into chemical energy stored in glucose molecules. The process occurs mainly in the chloroplasts of plant cells and involves two main stages:

- Light-dependent reactions:

- Occur in the thylakoid membranes.
- Chlorophyll absorbs light energy, exciting electrons.
- Water molecules are split (photolysis), releasing oxygen, protons, and electrons.
- Energy from excited electrons is used to produce ATP and NADPH.

- Light-independent reactions (Calvin Cycle):

- Occur in the stroma.
- ATP and NADPH from the light-dependent stage are used to convert carbon dioxide into glucose.
- Carbon fixation occurs when CO_2 combines with ribulose biphosphate (RuBP), catalyzed by the enzyme Rubisco.

Significance:

- Produces oxygen necessary for respiration.
- Forms the base of most food chains.
- Regulates atmospheric CO_2 levels.

Question 2: Explain Mendel's law of independent assortment with an example.

Memorandum Answer:

Mendel's law of independent assortment states that alleles for different genes segregate independently of one another during gamete formation. This results in the inheritance of one trait not

influencing the inheritance of another.

Example:

Consider a dihybrid cross involving seed shape (Round R, Wrinkled r) and seed color (Yellow Y, Green y):

- Parent genotype: RrYy (heterozygous for both traits)
- The gametes produced can be: RY, Ry, rY, ry

According to the law, these combinations are formed independently, leading to a 9:3:3:1 phenotypic ratio in the F₂ generation.

Conclusion:

This law explains the variety of phenotypes observed and is fundamental in understanding genetic inheritance patterns.
