 - True ribs (1-7): Attach directly to the sternum via costal cartilage.
 - False ribs (8-10): Attach indirectly to the sternum.
 - Floating ribs (11-12): Do not attach to the sternum.
- **Thoracic vertebrae:** Twelve vertebrae (T1-T12) forming the posterior aspect of the thoracic cage, providing attachment points for the ribs.

Features of the Thoracic Cage

The thoracic cage protects vital organs such as the heart and lungs and provides attachment points for muscles involved in respiration and upper limb movement. Its structure includes:

- Ribs and costal cartilage
- Sternum
- Thoracic vertebrae

Muscles of the Thorax

- **Intercostal muscles:** External, internal, and innermost intercostals facilitate breathing.

- **Carpometacarpal, metacarpophalangeal, and interphalangeal joints:** Joints of the hand enabling fine movements.

Muscles of the Upper Limb

The muscles of the upper limb are categorized based on their location and function:

- **Shoulder muscles:** Deltoid, rotator cuff muscles (supraspinatus, infraspinatus, teres minor, subscapularis) facilitate movement and stability.
- **Arm muscles:** Biceps brachii, triceps brachii, brachialis, and coracobrachialis control shoulder and elbow movements.
- **Forearm muscles:** Divided into flexors and extensors, controlling wrist and finger movements.
- **Hand muscles:** Intrinsic and extrinsic muscles responsible for fine motor skills.

Neurovascular Structures of the Thorax and Upper Limb

Nerves of the Thorax

- **Intercostal nerves:** Arise from thoracic spinal nerves T1-T11, supplying the intercostal muscles and skin.
- **Phrenic nerve:** Originates from C3-C5, vital for diaphragm innervation and respiration.

Overview of Chaurasia Anatomy Thorax and Upper Limb

The anatomy of the thorax and upper limb is fundamental to understanding human physiology, biomechanics, and clinical medicine. The thorax, serving as a protective cage for vital organs such as the heart and lungs, comprises bones, muscles, nerves, and vessels that work in harmony to facilitate respiration, circulation, and movement. The upper limb, from shoulder to fingertips, encompasses a complex arrangement of bones, joints, muscles, nerves, and blood vessels enabling a wide range of motions and functions.

Chaurasia's anatomy provides a detailed, systematically organized presentation of these regions, integrating anatomical structures with their functional and clinical aspects. Its detailed illustrations,

clinical notes, and comparative anatomy sections make it a preferred textbook for both undergraduate and postgraduate studies.

Thorax Anatomy

The thorax, or chest, is a conical bony structure that forms the skeletal framework of the thoracic cavity. It houses the heart and lungs and plays a crucial role in respiration and protection.

Bony Framework of the Thorax

The thoracic cage consists of:

- Ribs (12 pairs): Classified as true (1-7), false (8-10), and floating (11-12).
- Sternum: Comprising the manubrium, body, and xiphoid process.
- Thoracic vertebrae: T1-T12.

Features & Clinical Significance:

- The shape and elasticity of the ribs influence respiratory mechanics.
- Variations such as pectus excavatum or carinatum affect thoracic volume and can have clinical implications.

Muscles of the Thorax

Primary muscles include:

- Intercostal muscles: External, internal, and innermost intercostals?facilitate respiration.
- Diaphragm: The principal muscle of respiration.
- Other accessory muscles: Scalene, sternocleidomastoid.

Features & Clinical Relevance:

- Dysfunction or paralysis of the diaphragm can lead to respiratory compromise.
- The intercostal muscles are crucial landmarks for nerve blocks and thoracic surgeries.

Vascular Structures

Key arteries and veins:

- Aorta and its branches: Thoracic aorta, internal thoracic arteries.
- Venous drainage: Azygous system, internal thoracic veins.

Clinical notes:

- Understanding vascular pathways is essential in thoracic surgeries and managing trauma.

Nerves of the Thorax

Major nerves include:

- Intercostal nerves: T1-T11.
- Vagus nerve and sympathetic trunk: Innervate thoracic organs.

Features & Pathology:

- Intercostal nerve blocks provide analgesia.
- Damage to thoracic nerves can cause neuralgias or paralysis of intercostal muscles.

Upper Limb Anatomy

The upper limb is designed for mobility and dexterity, comprising the shoulder girdle, arm, forearm, and hand.

Bone Structure

- Pectoral girdle: Clavicle and scapula.
- Arm: Humerus.
- Forearm: Radius and ulna.
- Hand: Carpals, metacarpals, phalanges.

Features & Variations:

- Variations such as accessory bones can be clinically significant.
- Fractures (e.g., clavicular, humeral) are common trauma cases.

Muscular Anatomy

- Shoulder muscles: Deltoid, rotator cuff (supraspinatus, infraspinatus, teres minor, subscapularis).
- Arm muscles: Biceps brachii, triceps brachii, brachialis.
- Forearm muscles: Flexors (anterior compartment), extensors (posterior compartment).
- Hand muscles: Thenar, hypothenar, lumbricals, interossei.

Features & Clinical Insights:

- Rotator cuff injuries are prevalent in athletes.
- Muscle innervation patterns are critical for nerve injury diagnosis.

Nerve Supply of the Upper Limb

Key nerves:

- Brachial plexus: Roots (C5-T1) give rise to major nerves.
- Major nerves: Median, ulnar, radial, musculocutaneous, axillary.

Clinical Relevance:

- Brachial plexus injuries result in paralysis or sensory loss.
- Nerve entrapment syndromes (e.g., carpal tunnel syndrome) are common.

Vascular Supply

- Arterial supply: Subclavian artery becomes axillary, then brachial artery.
- Venous drainage: Cephalic, basilic, and median cubital veins.

Features & Clinical Utility:

- Knowledge of vascular anatomy aids in intravenous access and surgeries.

Question What are the key muscles involved in the movement of the thoracic wall during respiration? The primary muscles involved are the diaphragm, external intercostal muscles, internal intercostal muscles (external and internal layers), and accessory muscles like the scalene and sternocleidomastoid muscles during deep or labored breathing. How are the brachial plexus roots organized and what is their significance in upper limb innervation? The brachial plexus is formed by roots C5 to T1, which pass through the scalene muscles and give rise to trunks, divisions, cords, and terminal branches. It provides motor and sensory innervation to the upper limb, making it crucial for limb movement and sensation. What are the main features of the thoracic cage anatomy relevant to clinical practice? The thoracic cage consists of the sternum, 12 pairs of ribs, and thoracic vertebrae. It protects vital organs like the heart and lungs, plays a role in respiration, and provides attachment points for muscles of the upper limb and back. Describe the anatomical boundaries of the axilla and its clinical importance. The axilla is bounded anteriorly by the pectoralis major and minor, posteriorly by subscapularis, teres major, and latissimus dorsi, medially by the serratus anterior and first few ribs, and laterally by the intertubercular sulcus of the humerus. It contains neurovascular structures supplying the upper limb, making it important in surgeries and trauma management. Which arteries supply blood to the thoracic wall and upper limb, and what are their main branches? The subclavian artery (becomes the axillary artery), which gives off branches like the thoracoacromial and lateral thoracic arteries, supplies the thoracic wall. The axillary artery continues as the brachial artery in the upper limb, giving off branches such as the profunda brachii. The subclavian artery also gives rise to the internal thoracic artery for the anterior thoracic wall. What are the common clinical sites of nerve compression in the upper limb related to the brachial plexus? Common sites include the thoracic outlet (causing thoracic outlet syndrome), the axillary sheath (compressing the cords), and the cubital tunnel (ulnar nerve). These compressions can lead to sensory deficits, motor weakness, or paralysis in the upper limb. How does the anatomy of the sternum facilitate thoracic surgeries and cardiopulmonary procedures? The sternum provides a central, relatively superficial site for median sternotomy, allowing access to the heart, thymus, and great vessels. Its flat, strong structure also serves as an attachment point for ribs and clavicles, making it essential in surgical approaches to the thoracic cavity.
