Practice Problems and Solutions in LS Chemistry

Problem 1: Calculating Molarity from Titration Data

Question: A 25.00 mL sample of hydrochloric acid (HCl) is titrated with 0.100 M sodium hydroxide (NaOH). It requires 30.50 mL of NaOH to reach the endpoint. What is the molarity of the HCl solution?

Solution:

- Moles of NaOH = Molarity $\times$ Volume = 0.100 mol/L $\times$ 0.03050 L = 0.00305 mol
- Since HCl and NaOH react in a 1:1 ratio:

Moles of HCl = Moles of NaOH = 0.00305 mol

- Molarity of HCl = Moles / Volume = 0.00305 mol / 0.02500 L = 0.122 mol/L

Answer: The molarity of the HCl solution is 0.122 M.

Problem 2: Determining the pH of a Solution

Question: What is the pH of a 0.01 M solution of sulfuric acid (H₂SO₄)?

Solution:

- H₂SO₄ is a strong acid and dissociates completely in its first proton:

- The second dissociation is partial but can be approximated as strong for dilute solutions.
- Total H⁺ concentration $\approx$ 0.01 M (from first dissociation) + 0.01 M (from second dissociation, assuming full dissociation for simplicity)
- Approximate total [H⁺] $\approx$ 0.02 M

$$- \text{pH} = -\log[\text{H}^+] = -\log(0.02) \approx 1.70$$

Answer: The pH of the solution is approximately 1.70.

Question What are common methods to balance LS Chemistry equations? Common methods include balancing by inspection, algebraic methods, or using the ion-electron method for redox reactions to ensure the same number of atoms and charge on both sides. How do you determine the limiting reagent in a chemistry reaction? To identify the limiting reagent, compare the

mole ratios of reactants based on the balanced equation; the reagent that produces the least amount of product is the limiting reagent. What is the significance of the mole concept in LS Chemistry? The mole concept allows chemists to count particles, convert between mass and number of particles, and perform stoichiometric calculations accurately in reactions. How can I find the empirical formula from percent composition? Convert the percentage of each element to grams, then to moles, divide all by the smallest number of moles to find the ratio, and write the empirical formula accordingly. What is the difference between an ionic and a covalent bond? An ionic bond forms between metal and non-metal atoms via transfer of electrons, resulting in ions, whereas a covalent bond involves sharing electrons between non-metal atoms. How do I calculate the molar mass of a compound? Add the atomic masses of all atoms in the chemical formula of the compound using the periodic table to find its molar mass.
