- Using inverse operations
- Isolating variables

Example Approach:

When solving an equation like $3(x + 4) - 5 = 2x + 1$, students should:

- Distribute and simplify: $3x + 12 - 5 = 2x + 1$
- Combine like terms: $3x + 7 = 2x + 1$
- Isolate the variable: $3x - 2x = 1 - 7$
- Solve for x : $x = -6$

Tips:

- Always perform inverse operations to move terms across the equal sign.
- Check the solution by substituting back into the original equation.

- Understanding and Graphing Inequalities

Core Skills:

- Recognizing inequality symbols ($, <, >, \leq, \geq$)
- Solving the corresponding equation to find boundary points
- Graphing solution sets on a number line

Example:

Solve $2x - 3 > 7$

- Add 3 to both sides: $2x > 10$

- Divide both sides by 2: $x > 5$
- Graph on a number line with an open circle at 5, shading to the right

Visual Tips:

- Use different line styles to represent strict inequalities ($<$, $>$) versus inclusive ones ($\leq$, $\geq$).
- Practice translating word problems into inequalities for real-world application.

- Applying Algebraic Properties

Properties to Review:

- Commutative property: $a + b = b + a$
- Associative property: $(a + b) + c = a + (b + c)$
- Distributive property: $a(b + c) = ab + ac$

Practical Application:

Simplify expressions such as $3(2x + 4) - 5x$. Using the distributive property:

- Expand: $6x + 12 - 5x$
- Combine like terms: $x + 12$

Mastering these properties helps streamline problem-solving and simplifies complex expressions.

- Word Problems and Real-World Applications

Approach:

- Read carefully and identify what the problem asks for.
- Assign variables to unknown quantities.
- Translate words into algebraic expressions.
- Set up equations or inequalities based on the scenario.
- Solve and interpret solutions in context.

Sample Problem:

"Jane has twice as many apples as Tom. If Tom has x apples and Jane has $2x$, and together they have 24 apples, how many apples does each have?"

Solution Steps:

- Set up the equation: $x + 2x = 24$
- Simplify: $3x = 24$
- Solve for x : $x = 8$
- Find Jane's apples: $2x = 16$
- Answer: Tom has 8 apples, Jane has 16 apples.
