Question What is the formula for calculating the compound interest in numerical ability?
Answer The compound interest formula is $A = P(1 + r/n)^{nt}$, where P = principal amount, r = annual interest rate (in decimal), n = number of times interest is compounded per year, t = time in years, and A = amount after interest. The compound interest earned is $A - P$. How do you calculate the percentage increase or decrease between two numbers? Percentage change = $[(\text{New Value} - \text{Original Value}) / \text{Original Value}] \times 100\%$. If the result is positive, it's a percentage increase; if negative, a decrease. What is the formula for work and time problems involving speed? $\text{Work} = \text{Speed} \times \text{Time}$. For combined work, total work done = sum of individual work rates, and total time = total work / combined rate. How do you find the average of a set of numbers? $\text{Average} = \text{Sum of all numbers} / \text{Total number of values}$. What is the formula for calculating profit percentage? Profit percentage = $(\text{Profit} / \text{Cost Price}) \times 100\%$. Profit = Selling Price - Cost Price. How is the ratio and proportion used in numerical ability questions? In ratio problems, the relation between quantities is expressed as a ratio, and in proportion problems, the equality of two ratios is used: $a/b = c/d$. What is the formula for simple interest? Simple Interest = $(\text{Principal} \times \text{Rate} \times \text{Time}) / 100$, where Principal is the initial amount, Rate is annual interest rate, and Time is in years. How do you solve problems involving ages using formulas? Use the relation: Present age = Past age + elapsed years, and set up equations based on given conditions. Commonly, age problems are solved by forming equations and solving for the unknown age. What is the formula for calculating speed in distance and time problems? $\text{Speed} = \text{Distance} / \text{Time}$. To find any unknown, rearrange the formula accordingly. How do you approach problems involving mixtures and allegations? Use the allegation method to find the ratio of components. The formula is $(\text{Higher \%} - \text{Mean}) / (\text{Mean} - \text{Lower \%}) = \text{Quantity of lower percentage} / \text{Quantity of higher percentage}$.

Explanation:

Natural gas primarily consists of methane, which is a major hydrocarbon used as a fuel source.

Question 2: Short Answer

Explain the process of water softening by the lime-soda process.

Solution:

The lime-soda process is a common method for removing hardness-causing ions (calcium and magnesium) from water. The process involves adding lime (Ca(OH)_2) and sodium carbonate

(Na₂CO₃) to the hard water. The steps are:

- Addition of lime:

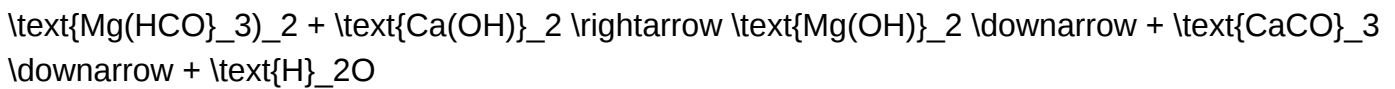

Lime reacts with bicarbonates of calcium and magnesium to form insoluble carbonates:

\[

\]

\[

\]

- Addition of sodium carbonate:

Removes residual calcium and magnesium ions by forming soluble sodium salts.

- Filtration:

The insoluble carbonates settle out, leaving soft water.

Advantages:

- Removes temporary hardness effectively
- Produces water suitable for industrial use

Question 3: Numerical Problem

Calculate the standard cell potential for the following electrochemical cell:

\[

]

Given data:

- $E^\circ_{\text{Zn}^{2+}/\text{Zn}} = -0.76 \text{ V}$
- $E^\circ_{\text{Cu}^{2+}/\text{Cu}} = +0.34 \text{ V}$

Solution:

The cell potential E°_{cell} is calculated as:

[

$$E^\circ_{\text{cell}} = E^\circ_{\text{cathode}} - E^\circ_{\text{anode}}$$

]

Since copper is reduced and acts as the cathode:

[

$$E^\circ_{\text{cathode}} = +0.34 \text{ V}$$

]

Zinc is oxidized (anode):

[

$$E^\circ_{\text{anode}} = -0.76 \text{ V}$$

]

Therefore:

[

$$E^\circ_{\text{cell}} = 0.34 - (-0.76) = 0.34 + 0.76 = 1.10 \text{ V}$$

\]

Result:

The standard cell potential is 1.10 V.
