Sample Neurosurgery Rounds Questions and Model Answers

Below are illustrative examples of common questions encountered during neurosurgical rounds, along with comprehensive answers.

Question 1: A 55-year-old man presents with sudden-onset headache, neck stiffness, and photophobia. CT scan reveals a subarachnoid hemorrhage. What is the most likely cause, and what is the immediate management?

Answer:

The most likely cause of spontaneous subarachnoid hemorrhage in this patient is a ruptured cerebral aneurysm, with anterior communicating artery aneurysm being common. Immediate

management includes:

- Hemodynamic stabilization: maintaining blood pressure to prevent rebleeding.
- Neurological assessment: using the Glasgow Coma Scale.
- Early neurocritical care: including nimodipine to reduce vasospasm.
- Confirmatory imaging: cerebral angiography to localize the aneurysm.
- Surgical or endovascular intervention: coiling or clipping of the aneurysm to prevent rebleeding.

Discussion:

Rapid diagnosis and stabilization are crucial. Neurosurgical options depend on aneurysm location, patient condition, and available expertise.

Question 2: How do you differentiate between a meningioma and a schwannoma on MRI?

Answer:

Meningiomas and schwannomas can appear similar but have distinguishing features:

- Location: Meningiomas are extra-axial tumors attached to dura, often broad-based. Schwannomas, such as vestibular schwannomas, involve the nerve sheath and are centered along cranial nerves.

- MRI features:
 - Meningioma:
 - Dural tail sign
 - Homogeneous enhancement
 - Often attached to dura mater
 - Schwannoma:
 - Located along nerve pathways
 - Heterogeneous enhancement
 - May show cystic degeneration
- Additional clues: Presence of peritumoral edema is more common in meningiomas.

Question 3: A patient with a history of head trauma develops rapidly worsening neurological deficits. CT shows an epidural hematoma. What is the typical source of bleeding, and what is the surgical emergency?

Answer:

Epidural hematomas are typically caused by arterial bleeding, most often from the middle meningeal artery, due to fracture of the temporal bone. The classic presentation involves a "lucid interval" followed by rapid deterioration.

Surgical emergency:

- Immediate surgical evacuation of the hematoma via craniotomy to prevent herniation and brainstem compression.
- Supportive care includes maintaining airway, breathing, circulation, and intracranial pressure management.

Discussion:

Rapid recognition and intervention are vital, as epidural hematomas can rapidly become life-threatening.
