Question 2: Genetics and Inheritance

Sample Question:

In a heterozygous individual with genotype Aa, what is the probability of passing on the recessive allele to offspring?

Correct Answer:

50%

Explanation:

In Mendelian genetics, heterozygous individuals (Aa) have a 50% chance of passing on either allele during gamete formation. When crossing with another heterozygote, Punnett squares reveal the expected genotypic ratios.

Key Concepts:

- Heterozygous (Aa) produces gametes with A or a in equal proportions.
- Probability of passing the recessive allele (a): 1/2 or 50%.

Question 3: Evolution and Natural Selection

Sample Question:

Which of the following best explains how antibiotic resistance develops in bacterial populations?

Correct Answer:

Natural selection acting on genetic variation

Explanation:

Bacteria naturally exhibit genetic variation. When antibiotics are used, bacteria with resistance genes survive and reproduce, passing these traits to offspring. Over time, resistant strains dominate? a classic example of natural selection.

Important Points:

- Resistance genes may arise via mutation or horizontal gene transfer.
- Antibiotic use applies selective pressure favoring resistant bacteria.

Question 4: Ecology and Ecosystems

Sample Question:

In a food chain, which organism is typically at the top of the trophic levels?

Correct Answer:

A tertiary consumer or apex predator

Explanation:

Trophic levels follow a hierarchy:

- Producers (plants)

- Primary consumers (herbivores)
- Secondary consumers (carnivores)
- Tertiary consumers (top predators)

Understanding these levels helps interpret ecological relationships and energy flow.

Tip: Remember, apex predators have no natural enemies within their ecosystem.

Question 5: Biological Processes and Systems

Sample Question:

Which process allows plants to convert sunlight into chemical energy?
