Question What are the primary external features to identify during a perch dissection? **Answer** Key external features include the dorsal fin, pectoral fins, pelvic fins, anal fin, caudal fin, gills, mouth, and operculum (gill cover). Recognizing these helps orient the dissection and locate internal organs. How do you locate and identify the perch's swim bladder during dissection? The swim bladder is a gas-filled sac located dorsal to the stomach and intestines. It appears as a translucent, elongated sac and helps the fish control buoyancy. Carefully exposing the dorsal body cavity reveals the swim bladder. What is the significance of the perch's lateral line system, and how is it identified in the dissection? The lateral line system detects vibrations and water movement, aiding in navigation and prey detection. It appears as a series of small pores or lines running along each side of the fish's body, which can be observed externally during dissection. Which internal organs are examined during a perch dissection, and what are their functions? Internal organs include the heart (pumps blood), liver (detoxifies and produces bile), stomach (digests food), intestines (absorb nutrients), gonads (reproductive organs), and kidneys (excrete waste). Dissecting these helps understand the fish's biology and organ functions. What safety precautions should be taken during a perch dissection lab? Always wear gloves and safety goggles to protect against chemicals and biological materials. Use dissection tools carefully, avoid cutting towards yourself, and dispose of biological waste properly following lab protocols.
